Program 1 : Simple Thread Program

```
class MyThread extends Thread {
    public void run() {
        for (int i = 1; i <= 5; i++) {
            System.out.println("Thread is running: " + i);
        }
    }
}

public class Main {
    public static void main(String args[]) {
        MyThread t1 = new MyThread();

        t1.start();
    }
}
```

Output :

```
Thread is running: 1
Thread is running: 2
Thread is running: 3
Thread is running: 4
Thread is running: 5
```

Program 2 : Thread creation and Thread naming using Thread class

```
class ThreadDemo extends Thread {
    public void run() {
        System.out.println("Thread is running");
    }
}
```

```
class ThreadDemoTest {
    public static void main(String args[]) {
        ThreadDemo t1 = new ThreadDemo();
        ThreadDemo t2 = new ThreadDemo();
        t1.start();
        t2.start();
        System.out.println(t1.getName());
        System.out.println(t2.getName());

        t1.setName("AS2");
        t2.setName("AS1");

        System.out.println(t1.getName());
        System.out.println(t2.getName());

    }
}
```

Output :

```
Thread-0
Thread-1
Thread is running
Thread is running
AS2
AS1
```

Program 3 : Thread Joining

```
public class TestJoin {
    public static void main(String[] args) {
        Thread t1 = new Thread(() -> {
            System.out.println("Thread 1 is running");
        });
        Thread t2 = new Thread(() -> {
            System.out.println("Thread 2 is running");
        });
        t1.start();
        try {
            t1.join();
        } catch (InterruptedException e) {
            System.out.println("Interrupted");
        }
        t2.start();
    }
}
```

Output :

Thread 1 is running

Thread 2 is running

Program 4 : Thread program using sleep()

```
class SleepDemo extends Thread {
    public void run() {
        for (int i = 1; i <= 5; i++) {
            System.out.println(i);

            try {
```

```
                Thread.sleep(1000);
            } catch (InterruptedException e) {
                System.out.println(e);
            }
        }
    }
}

public class SleepMethodDemo {
    public static void main(String args[]) {
        SleepDemo t1 = new SleepDemo();
        t1.start();
    }
}
```

Output :

1

2

3

4

5
